1 Introduction

The Makfile.project.part.defines generator is a DaVinci Automation Interface scripts which generates the a template for the file Makfile.project.part.defines.

The file Makfile.project.part.defines is required by the Vector build environment “MakeSupport” but not included in deliveries without a demo. To be able to use the Vector build environment also without a demo, this generator can be used.

2 Functional Description

To run the generator, it must be added in the DaVinci Configurator Pro Script Settings. Afterwards the script can be executed in Script Tasks view:

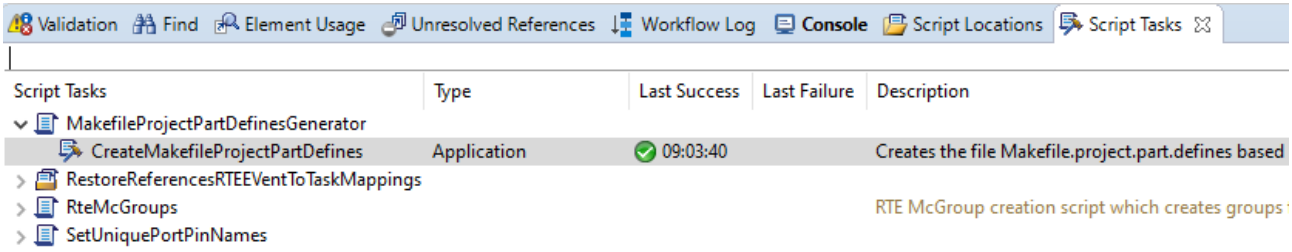

Figure 2-1 Script Tasks View in DaVinci Configurator Pro

The script creates the file “_Makefile.project.part.defines” in the Appl directory parallel to the current DaVinci projects DPA file.

This file is a template, it can be renamed to “Makefile.project.part.defines” to use in in the Vector build environment.

Note that manual adaptions (for example E2E configuration, MCAL exclude switches, application specific source files) must be done manually in this file.
