1 Introduction

The component-based delivery structure puts emphasize on the single component. In other words, this delivery is built up of a set of components, accomplished with cross-cutting tools and documentation.

Everything that is necessary for a component is now stored below one folder, the component folder. This also comprises all necessary documentation, e.g. the technical reference.

1.1 Main Folders

The top folders are **Components**, **DaVinci Configurator**, **Documentation**, **Misc** and **ThirdParty**.

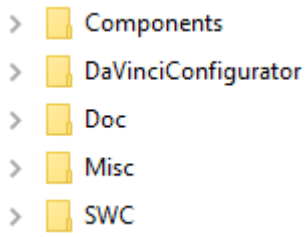

Figure 1-1 Top-Level Folder

1.1.1 Components Folder

The Component Folder contains a **_Common** folder and the folders for the different basic software modules and the software components.

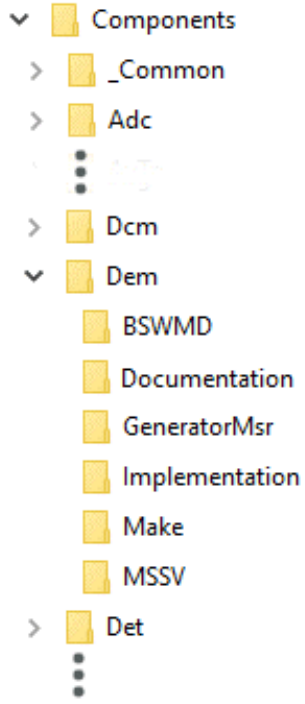

Figure 1-2 Components Folder

1.1.2 _Common

This folder contains header file templates applicable for several components and templates like `_Compiler_Cfg.h`, `_MemMap.h`.

Note
The underscore before the header file names marks it as a template. When you use the templates for your project, please copy the files to your project and remove the leading underscore.

1.1.3 Component (<Msn>)

Each single component folder contains everything that is necessary for the component. In detail:

Note
Not all folders are always available. .

- **BSWMD**

  Basic Software Module Description files

- **Converters**

  Converters for input files

- **DaVinciCfg_AutomationScripts**

  Scripts, that can be used within the DaVinci Configurator Classic for automation

- **DaVinciCfg_VASE**

  Vector AUTOSAR Scripting Engine scripts that can be used within the DaVinci Configurator Classic input file update.

- **Documentation**

  Component-specific documentation, mainly the technical reference.

- **Generator**

  Generator which is triggered by the generation process.

- **GeneratorMsr**

  Generator part and further files of the component used by DaVinci Configurator Classic.

- **Implementation**

  Static source header files, libraries and templates.

- **Make**

Make files describing which files and include directories are used to build the component.

- **McData**

  A2L files.

- **SWC**

  Application Software Component Description files.

1.2 DaVinciConfigurator

This folder contains the configuration tool DaVinci Configurator Classic and all necessary files like **BswmdModel** (generated when using the tool) and **Platform Types**. The tool itself is in the subfolder **Core**.

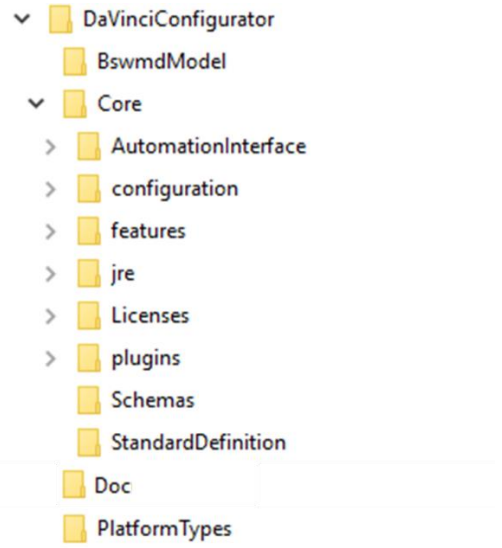

Figure 1-3 DaVinci Configurator Classic Folder

1.3 Documentation

This folder still contains the document types **Application Notes**, **DeliveryInformation**, **ReleaseNotes**, **SafetyManual** (dependent on ASIL), **TechnicalReference** and **UserManuals**. All documents in these folders are not component-specific and describe cross-module topics.

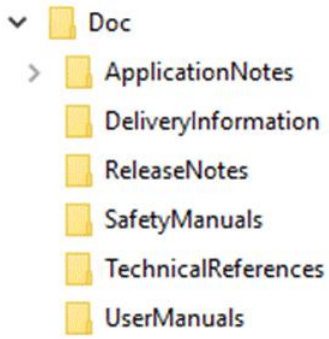

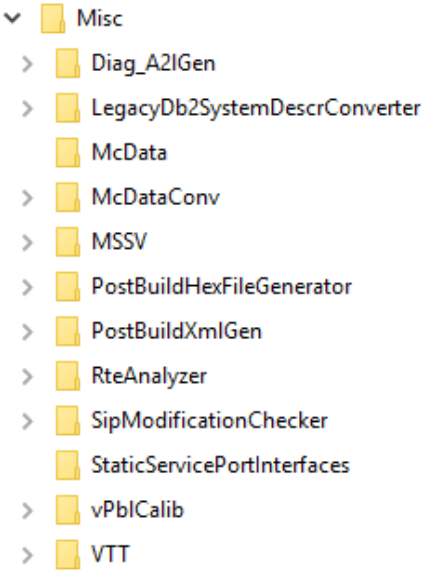

Figure 1-4 Documentation Folder

1.4 Miscellanous

The content of the **Misc** folder contains content which is not related to a component (i.e. generators, tool, checker, etc.). Which of them are provided depends on your delivery.

1.5 ThirdParty

The content of this folder comprises all software or tools with a third-party source. This could be an MCAL and other content which is not of Vector Informatik GmbH legal property and thus cannot be delivered.

An exception is the McalIntegrationHelper, this is to for integration help of third-party source software.

2 Delivery Structure Differences at a Glance

The following illustration shows the migration strategy between the legacy and the component-based delivery structure.
