VECTOR

vVIRTUALtarget

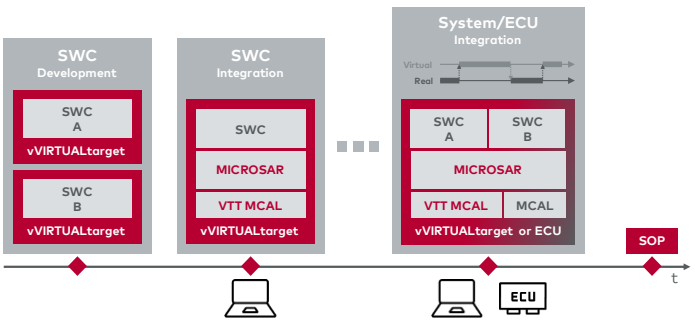

Hardware independent Configuration & Testing

Significant Time and Costs Advantage

vVIRTUALtarget is a virtualization software of the runtime environment in which the ECU software can be configured, executed, tested, and transferred to the target hardware and back to vVIRTUALtarget at any time without the otherwise required hardware and decoupled from the basic software.

Advantages

- Early integration and testing of MICROSAR software modules
- Development of the ECU software independent of the availability of the real target hardware
- Dual target option for parallel integration on virtual and real hardware
- Greater depth of testing by additional testing in the virtual environment
- Microsoft Visual Studio is used as a convenient development and debugging environment
- Use of vVIRTUALtarget does not change workflow in ECU development
- Improved simulation of interruptions by interrupts and task preemption
- Simulation of multi-core systems
